

PIXELFORENSICS

Deepfake Analysis Report

Report ID: B7D2E5762BB4
Generated: March 26, 2026 at 02:15 PM
Analyzed File: tryit.jpg
File Type: IMAGE

✓ AUTHENTIC / REAL

Confidence Score: 65.9%

Executive Summary:

Our analysis indicates with 65.9% confidence that this image appears to be authentic. 3 out of 6 detection methods found characteristics consistent with genuine photographs. The image exhibits natural properties expected from real camera sensors and optical systems.

Detailed Analysis

Multi-Method Ensemble Detection

Detection Method	Verdict	Confidence	Weight
Secondary detector (98.2% acc)	■ FAKE	66.1%	1.0
Frequency Analysis	■ REAL	70.0%	0.6
ELA Analysis	■ FAKE	94.0%	0.6
Noise Analysis	■ REAL	74.0%	0.6
Color Analysis	■ FAKE	94.0%	0.5
Metadata Analysis	■ REAL	50.0%	0.8-1.2*

Methods Voting FAKE:	3 / 6
Weighted Ensemble Score:	45.5%
Decision Threshold:	52%

* Metadata weight increases to 1.2 when no EXIF data is found

EXIF Metadata Analysis

■■ NO EXIF METADATA FOUND

What this means: The absence of EXIF metadata is highly suspicious and commonly observed in AI-generated images. However, it can also occur in:

- Screenshots of genuine images
- Images downloaded from websites (metadata often stripped)
- Photos edited in apps that remove EXIF data
- Images shared through messaging apps
- AI-generated or synthetic images (most common)

Technical Details

AI Models Deployed

Model Name	Type	Accuracy	Status
dima806/ai_vs_real	ViT Transformer	98.2%	✓ Active
Ateeqq/ai-vs-human	SigLIP2	99.2%	■ Optional

Detection Methods Explained

Frequency Analysis: Examines the distribution of frequency components in the image using FFT. AI-generated images often show unnatural frequency patterns.

Error Level Analysis (ELA): Compares compression artifacts between original and recompressed versions. AI images show unusually uniform compression patterns.

Noise Analysis: Analyzes sensor noise patterns. Real cameras have characteristic noise signatures that AI generators cannot perfectly replicate.

Color Analysis: Examines color distribution, saturation, and histogram smoothness. AI images often display statistically anomalous color properties.

Metadata Analysis: Checks for authentic camera EXIF data. Real photos contain detailed camera settings, timestamps, and device information.

Conclusion

The analysis suggests this image is **likely authentic**, though confidence is moderate. Most detection methods found genuine characteristics, but some ambiguity remains. Consider the context and source when evaluating authenticity.

Important Disclaimer

- This report is generated by an automated AI detection system and should be used as a preliminary assessment tool only.
- The results are based on statistical analysis and machine learning models that, while highly accurate, are not infallible.
- For critical decisions (legal proceedings, forensic investigations, or high-stakes verification), this report should be supplemented with expert human analysis and additional forensic tools.
- PixelForensics makes no warranties about the absolute accuracy of these results and accepts no liability for decisions made based on this report alone.
- Accuracy metrics are based on validation testing and may vary with real-world images. The system is regularly updated to detect new AI generation techniques.
